Avaliar UX

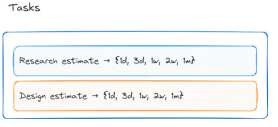

## Proposed UX Relevance Quick Method — V1 & V2

## Document Sections Summary

**1. Proposed UX Relevance Quick Method and Existing Tools**

- 1.1 Overview of a lightweight assessment method that combines R2S matrix, UX Check Tool, and PD calculator to compute a single UX Relevance score using 1-5 Likert scale
- 1.2 R2S Matrix: Visual matrix that determines priority based on Task Complexity and User Interaction levels
- 1.3 Current UX Check Tool: BMC's official tool for evaluating UX Relevance of activities
- 1.4 PD calculator: an Excel macro tool that, based on the project context, determines the UX activities and their durations

**2. CIM already existing fields**

- Visual gallery showing 10 existing CIM (Continuous Improvement Management) fields including estimated effort, benefit, capacity, implementation effort, priority, strategic dimensions, component, due date, idea source, and resource type
- These are the fields that must be completed before the assessment phase

**3. Version 1: CIM-Enhanced UX Relevance Assessment**

- 3.1 Inputs and CIM Mapping: Complete implementation of 10-question Likert assessment with manual inputs (Q1-Q3) and auto-filled inputs from CIM data (Q4-Q10), including detailed mapping rules for all CIM fields
- 3.2 Scoring Algorithm: Normalization and scoring methodology with decision bands (LOW/MEDIUM/HIGH) and workflow diagram
- Comprehensive mapping showing how CIM field values automatically translate to UX assessment inputs, including business priority, strategic relevance, UX potential impact, effort scope, freedom to shape UX, touchpoint coverage, user interaction level, and time urgency

**4. Version 2: CIM-Enhanced Effort Estimation**

- 4.1 Additional Inputs for Effort Estimation: Builds upon Version 1 by adding research breadth, design complexity, validation depth, and stakeholder groups inputs
- 4.2 Effort Estimation Algorithm: Advanced algorithmic calculations that combine Version 1 results with additional inputs to generate Research and Design time estimates (1d to 1m), including workflow diagram

**5. Visual Wireframe Reference**

- Reference to the comprehensive wireframe diagram (`my-wireframe-merged.excalidraw`) that visually illustrates the complete UX Relevance Quick Method workflow for both Version 1 and Version 2

The document presents a comprehensive methodology for integrating existing CIM data with UX assessment tools to create an automated, data-driven approach to UX project evaluation and effort estimation, supported by a visual wireframe diagram illustrating the complete workflow.

---

## 1. Proposed UX Relevance Quick Method and Existing Tools

### 1.1 Proposed UX Relevance Quick Method (Likert, <=10 questions)

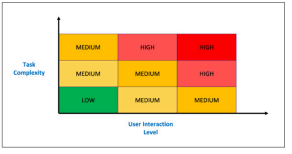

This lightweight assessment blends three inputs to compute a single UX Relevance score:

- R2S matrix: Task Complexity x User Interaction
- UX Check Tool: Degree of UX influence (**UX-7**), freedom (**UX-9**), touchpoint coverage (**UX-10**), potential impact (**UX-12**)
- PD calculator proxy: Expected scope/effort of UX activities

Use the 1-5 Likert scale for every question (1=Low/None, 3=Medium, 5=High/Extensive). Keep answers factual and tied to the specific project.

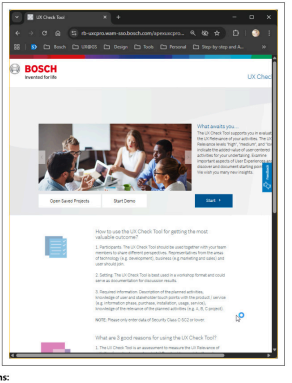

## 1.2 R2S Matrix

The R2S matrix determines priority based on Task Complexity and User Interaction levels:

## 1.3 Current UX Check Tool

The existing UX Check Tool supports evaluating UX Relevance of activities:

**Current UX Check Tool Questions:**

**Basic Information:**

- **UX-1:** Activity / project name*:
- **UX-2:** Official ID (optional):
- **UX-3:** Activity / project description and most important goals:
- **UX-4:** Category of the activity / project:

**User Experience Assessment:**

- **UX-5:** Think of the touch points between your product / service and end users or stakeholders – e.g. information, purchase, installation, usage, and service (the Customer Journey)
- **UX-6:** Who are the end users and most important stakeholders, and what is their benefit from the planned solution?
- **UX-7:** To what extent will the User Experience of the product / service be shaped or influenced during the planned activities?
- **UX-8:** The activity / project addresses characteristics of the product / service that have a substantial effect on the User Experience (e.g. interaction, design, functionality)
- **UX-9:** There is a high level of freedom in shaping the User Experience.
- **UX-10:** All touch points with the end users and stakeholders will be systematically shaped.
- **UX-11:** The scope is complex with conflicting perspectives and defining a solution process is challenging.

**UX Potential and Impact:**

- **UX-12:** Beyond the scope of the current project, how big is the general UX potential impact of this product / service?
- **UX-13:** There are relevant user needs in the context of this product/service that should be addressed.
- **UX-14:** There is big potential in the implementation (and improvement) of the relevant UX Target States: usefulness, ease-of-use, joy-of-use, aesthetics, image-of-use.
- **UX-15:** There is big potential for an innovative User Experience in the product / service.
- **UX-16:** The systematic design of the various contact points with the user groups (end-user, stakeholders) will considerably improve the UX of the product / service.
- **UX-17:** A positive UX (e.g. in functionality, design, interaction, related services) is an increasingly crucial success factor for the product/service.

**Business and Strategic Relevance:**

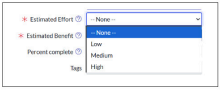

- **UX-18:** How high is the internal relevance of your project from a business or strategic point-of-view?
- **UX-19:** Business priority (e.g. turnover, number of users) is high.
- **UX-20:** Strategic relevance (e.g. future trend topics, entering new market) is high.

### 1.4 PD calculator

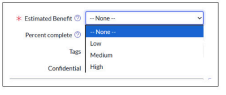

The existing PD calculator provides a structured approach to UX project planning:

## 2. CIM already existing fields

**CIM-1:** Estimated effort (low, medium or high).

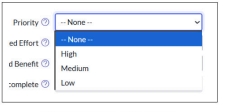

**CIM-2:** Estimated benefit (low, medium or high).

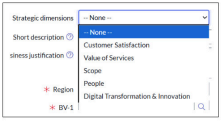

**CIM-3:** Planned freed-up capacity (hours/month).

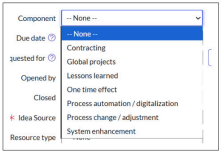

**CIM-4:** Planned implementation effort (total in hours).

**CIM-5:** Priority (high, medium or low).

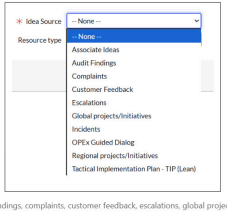

**CIM-6:** Strategic dimensions (customer satisfaction, value of services, scope, people, digital transformation, and innovation).

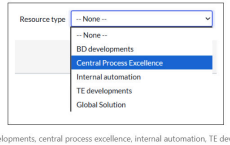

**CIM-7:** Component (contracting, global projects, lessons learned, one-time effect, process automation/digitalization, process change/adjustment, and system enhancement).

**CIM-8:** Due date (date).

**CIM-9:** Idea Source (associate ideas, audit findings, complaints, customer feedback, escalations, global projects/initiatives, incidents, OPEX guided dialog, regional projects/initiatives, tactical implementation plan - TIP (Lean)).

**CIM-10:** Resource type (BD developments, central process excellence, internal automation, TE developments, and global solution).

## 3. Version 1: CIM-Enhanced UX Relevance Assessment

🎨 **Visual Coding Legend:**

- 🔵 **Blue Circle:** Manual inputs only (no CIM calculation possible)
- 🟢 **Green Circle:** Auto-calculated from CIM data (can be manually overridden if needed)

### 3.1 Inputs and CIM Mapping

🟢 **Auto-calculated from CIM (with manual override capability)**

**Q1 Task Complexity:** Auto from **CIM-1** estimated effort + **CIM-4** implementation effort + **CIM-5** priority; **editable** (R2S)

- Estimated effort Low/Medium/High -> 1/3/5
- Implementation effort (h) buckets: <=40 -> 1, 41-160 -> 2, 161-320 -> 3, 321-640 -> 4, >640 -> 5
- Priority Low/Medium/High -> 1/3/5
- Combine: round(0.4 * Estimated + 0.4 * Implementation + 0.2 * Priority)

**Q2 User Interaction Level:** Auto from **CIM-7** component; **editable** (R2S)

- One-time effect/Lessons learned -> 1 (Minimal/No Direct User Interaction)
- Contracting/Global projects -> 2 (Low User Interaction)
- Adjustment -> 3 (Moderate User Interaction)
- Process change/system enhancement -> 4 (High User Interaction)
- Process automation/digitalization -> 5 (Extensive User Interaction)

**Q4 Freedom to Shape UX:** Auto from **CIM-10** resource type (**UX-9** - There is a high level of freedom in shaping the User Experience)

- Global solution -> 2, TE developments -> 3, BD developments -> 2, Central process excellence -> 3, Internal automation -> 4, (else) -> 3

**Q6 UX Potential Impact:** Auto from **CIM-2** estimated benefit + **CIM-3** freed-up capacity (**UX-12** - How big is the general UX potential impact of this product/service?)

- Benefit Low/Medium/High -> 1/3/5
- Freed-up capacity buckets: 0 -> 1, 1-20 -> 2, 21-50 -> 3, 51-100 -> 4, >100 -> 5
- Combine: round(0.5 * Benefit + 0.5 * FreedUpBucket)

**Q7 Expected UX Effort Scope:** Auto from **CIM-4** implementation effort + **CIM-1** estimated effort

- Implementation (h) buckets: <=40 -> 1, 41-160 -> 2, 161-320 -> 3, 321-640 -> 4, >640 -> 5
- Estimated effort Low/Medium/High -> 1/3/5
- Combine: round(0.6 * Implementation + 0.4 * Estimated)

**Q8 Business Priority:** Auto from **CIM-5** priority (High/Medium/Low -> 5/3/1) (**UX-19** - Business priority is high)

**Q9 Strategic Relevance:** Auto from **CIM-6** strategic dimension (+ **CIM-9** idea source) (**UX-20** - Strategic relevance is high)

- No dimension selected -> 1
- If dimension is "customer satisfaction" or "digital transformation" -> 5
- Other dimensions -> 3
- If idea source in (complaints, incidents, escalations, audit findings), min 4
    - *Note: "min 4" means the score will be at least 4, even if other calculations give a lower value*

**Q10 Time Urgency:** Auto from **CIM-8** due date (days until due) - Days until due -> urgency bucket: >180 -> 1, 91-180 -> 2, 61-90 -> 3, 31-60 -> 4, <=30 -> 5

🔵 Manual Input Only (no CIM calculation possible)

- **Q3 Degree UX Is Shaped: Manual input required** (**UX-7** - How much will this project change or improve the user experience? *[Rephrased for clarity]*
- **Q5 Touchpoint Coverage: Manual input required** (**UX-10** - Will we design and improve all the ways users interact (touchpoints) with this project? *[Rephrased for clarity]*)
    - *Touchpoints = any way users interact with your project (emails, meetings, forms, systems, processes, etc.)*

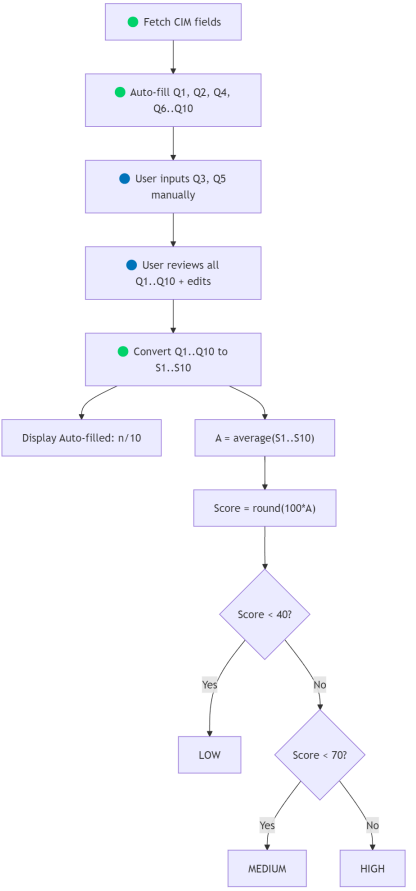

## 3.2 Scoring Algorithm

**Normalization and scoring**

- Convert all questions to S1..S10 on [0..1] via (x-1)/4
- A = average(S3..S10). Score = round(100 * A)
- Display an "Auto-filled: n/10" indicator to show coverage/confidence.
    - Shows how many of the 10 questions (S1-S10) were automatically filled from CIM data vs manually entered
    - Example: "Auto-filled: 7/10" means 7 questions were auto-populated, 3 required manual input
    - Indicates coverage (how comprehensive the CIM data was) and confidence level

**Decision bands**

- <40 -> LOW: Basic UX considerations
- 40-69 -> MEDIUM: Standard UX process
- =70 -> HIGH: Comprehensive UX involvement

Fetch CIM fields
Auto-fill Q1, Q2, Q4, Q6..Q10
User inputs Q3, Q5 manually
User reviews all Q1..Q10 + edits
Convert Q1..Q10 to S1..S10
Display Auto-filled: n/10
A = average(S1..S10)
Score = round(100*A)
Score < 40?
Yes
No
LOW
Score < 70?
Yes
No
MEDIUM
HIGH

## 4. Version 2: CIM-Enhanced Effort Estimation

Version 2 builds upon Version 1 by adding effort estimation capabilities for Research and Design phases.

### 4.1 Additional Inputs for Effort Estimation

🟢 **Auto-calculated from CIM (with manual override capability)**

**Q11 Research breadth:** Auto from **CIM-7** component + **CIM-6** strategic dimension; **editable**

- Component mapping: One-time effect/Lessons learned -> 1, Contracting/Global projects -> 2, Adjustment -> 3, Process change/system enhancement -> 4, Process automation/digitalization -> 5
- Strategic dimension boost: "customer satisfaction" or "digital transformation" -> +1 (cap 5 = maximum total value of 5)
- Combine: Component base + strategic boost

**Q12 Design complexity:** Auto from **CIM-7** component + **CIM-4** implementation effort; **editable**

- Component mapping: One-time effect/Lessons learned -> 1, Contracting/Global projects -> 2, Adjustment -> 3, Process change/system enhancement -> 4, Process automation/digitalization -> 5
- Implementation effort (h) buckets: <=40 -> 1, 41-160 -> 2, 161-320 -> 3, 321-640 -> 4, >640 -> 5
- Combine: round(0.6 * Component + 0.4 * Implementation)

🔵 **Manual inputs only (no CIM calculation possible)**

**Q13 How much do we need to check with actual users that our solution works well?**

- Extensive checking needed - we need to test multiple times with real users, get their feedback, and make improvements based on what they tell us (5)
- High checking needed - we need to test several times with real users and get their feedback (4)
- Moderate checking needed - we need to test some with real users and collect their feedback (3)
- Limited checking needed - we need basic feedback from users or simple testing (2)
- Minimal checking needed - we don't need much testing with real users (1)

**Q14 How many different user groups are affected?**

- Several groups (5)
- Many groups (4)
- Some groups (3)
- Few groups (2)
- One group (1)

### 4.2 Effort Estimation Algorithm

Definitions

- N5(x): Normalizes a 1–5 Likert to 0–1 as N5(x) = (x-1)/4.
- S: Version 1 score from Q1–Q10, scaled 0–100.
- G: Gate signal from Q7 (UX influence), Q9 (freedom), Q10 (touchpoint coverage): G = max(N5(Q7), avg(N5(Q9), N5(Q10))).
    - **Note on Gate Signal Logic:** The maximum function ensures conservative UX resource allocation. A project needs UX attention if EITHER: (1) It has high UX influence (Q7) - regardless of freedom/scope, OR (2) You have good freedom AND good touchpoint coverage (avg of Q9,Q10) - even if influence seems lower. This prevents under-resourcing projects that will heavily impact users or where you have good UX capabilities to make meaningful improvements.

Gate 0 — UX Need Gate (uses Q1–Q10)

- If S < 30 and G < 0.40 → Outcome: No dedicated UX (0d). Provide checklist/self-serve guidance only.
- Else if S < 45 and G < 0.50 → Outcome: Advisory only (≤1d timebox; design review/checklist). Skip research/design deliverables.
- Else → Proceed to estimation.

Estimation Inputs (Q11–Q14 + CIM)

- InfluenceIndex I = avg(N5(Q11 Research breadth), N5(Q12 Design complexity), N5(Q13 Validation depth)).
- ScopeProxy P ∈ {1..5} from CIM (e.g., using CIM-4 implementation effort and CIM-1 estimated effort).
- Urgency U ∈ {1..5} from CIM-8 due date bucket.
- Groups Gp ∈ {1..5} from Q14 (# of user groups affected).

Core Calculation

1. BaseRaw = 0.6·I + 0.2·(S/100) + 0.2·((P-1)/4).
2. Base = clamp(round(1 + 4·BaseRaw), 1, 5).
3. Adjustments
   - Urgency cap: if U ≥ 4 and S < 70 → Base = min(Base, 4).
   - Freedom cap: if Q9 ≤ 2 → Design cannot scale aggressively → DesignCap = 4.
     - *Note: When freedom to shape UX is limited (Q9 ≤ 2), design work is capped at 2 weeks maximum to avoid over-allocating resources that can't be effectively utilized due to organizational constraints.*
   - Research boost: if Gp ≥ 4 → Research +1; if CIM-6 strategic dimension includes "customer satisfaction" or "digital transformation" → Research +1 (cap at 5).
     - *Note: Research boosts recognize that projects with many user groups (Gp≥4) or strategic focus on customer satisfaction/digital transformation require deeper user insights. Both boosts can apply simultaneously but are capped at level 5 (1 month maximum).*

Final Indices and Buckets

- ResearchIndex = clamp(Base + researchBoost, 1, 5) unless a gate produced "No UX/Advisory".
- DesignIndex = clamp(min(Base, DesignCap when applied), 1, 5) unless a gate produced "No UX/Advisory".
- Map indices to time buckets: 0 → 0d, 1 → 1d, 2 → 3d, 3 → 1w, 4 → 2w, 5 → 1m.
  - For "Advisory only": Research = 0d, Design = 1d (review/timebox).

## ⚠️ UX Phase Time Constraints

**Maximum Time Limits Imposed:**

- **Research Phase**: Capped at **1 month (5 weeks)** maximum
- **Design Phase**: Capped at **1 month (5 weeks)** maximum
- **Combined UX Effort**: Maximum **2 months total** for both phases

**Key Constraints Applied:**

- **Freedom Cap**: When Q9 ≤ 2 (low freedom to shape UX), Design is limited to **2 weeks maximum**
- **Urgency Cap**: When U ≥ 4 (high urgency) and S < 70 (low UX relevance), Base effort is capped at **2 weeks maximum**
- **Research Boosts**: Can increase research time but are capped at **1 month maximum**
- **Gate Outcomes**: Projects with very low UX relevance get **0 days** (no UX) or **1 day** (advisory only)

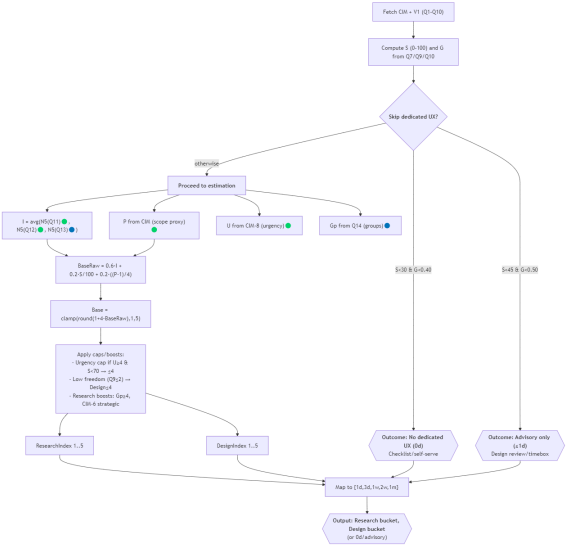

**Rationale for Constraints:**

- Prevents over-allocation of UX resources when organizational constraints limit implementation
- Ensures realistic timeframes that align with typical project schedules
- Balances thorough UX work with practical delivery timelines
- Focuses UX effort on projects where it can have meaningful impact

Why this is more reliable

- Gated: Explicitly supports "no UX" and "advisory-only" outcomes.
- Auditable: Simple, bounded formulas with clear caps/floors and named inputs.
- Realistic: Scales with both influence (Q11–Q13) and project scope (CIM), tempered by urgency and freedom.

Mermaid (V2 — revised)

## 5. Visual Wireframe Reference

A comprehensive wireframe diagram has been created showing the complete UX Relevance Quick Method workflow for both Version 1 (R2S + UX Check Tool) and Version 2 (with effort estimates). This visual representation illustrates the methodology flow, scoring algorithms, and decision points.

This visual diagram serves as a reference for understanding the complete methodology and can be used alongside the detailed written documentation for comprehensive understanding of the UX Relevance Quick Method.
